

EstimaPro App Summary

Source basis: repository evidence from /src, package.json, and README.md only.

What It Is

EstimaPro is a single-page Vue 3 + Vite web app for creating and managing project cost estimations. It uses Firebase Authentication and Firestore for user access and data persistence.

Who It Is For

Primary persona: Spanish-speaking freelancers or small teams who need per-user estimation tracking with quick create/edit/delete workflows and basic filtering.

What It Does

- Registers and logs in users with Firebase Auth (email/password).
- Protects routes: guest-only login/register and auth-only dashboard.
- Creates, updates, lists, and deletes estimations stored in Firestore.
- Scopes records by authenticated userId when loading dashboard data.
- Validates estimation form fields (required text, numeric amount > 0).
- Filters estimations by client/project text and min/max amount range.
- Formats amounts as MXN currency and shows Spanish success/error feedback.

How It Works (Architecture)

- UI Layer: Vue SFC views (Login, Register, Dashboard) + form/table components.
- Routing Layer: vue-router with beforeEach guard that waits for auth initialization.
- Auth Layer: useAuth composable wrapping Firebase Auth login/register/logout state.
- Data Layer: estimationsService performs Firestore CRUD on 'estimations' collection.
- Data Flow: User action -> component handler -> useAuth/service call -> Firebase -> UI refresh.
- Not found in repo: backend API service outside Firebase, queueing, analytics pipeline, tests.

How To Run (Minimal)

- Install deps: npm install
- Start dev server: npm run dev
- Open the local URL printed by Vite (typically http://localhost:5173).
- Build production bundle: npm run build
- Preview build: npm run preview
- Not found in repo: explicit Node version requirement and .env-based Firebase setup.
